SHINGLE ROOF ICE MELT SYSTEMS

THERMALINE products provide ice defense for every shingle roofing application. Our team will design a tailored system that performs efficiently and maintains the curb appeal of your property!

THERMASHINGLE

ThermaShingle is designed for both new and existing roofs, installing directly onto eave shingles without penetrating the roof deck.

THERMASHINGLE+

ThermaShingle+ uses patented technology to stop ice damming on new shingle roofs. It is affixed directly onto the ice and water shield with an adhesive and does not penetrate the roof deck.

THERMAVALLEY

ThermaValley uses a patented design to create and maintain a clean melt path for snow and ice in problematic valleys. This is paired with ThermaShingle on the eaves to stop ice damming and clear snow melt from the roof.

THERMAVALLEY+

ThermaValley+ uses patented technology to stop ice damming on new shingle valleys. It is affixed with an adhesive and does not penetrate the roof deck. This is paired with ThermaShingle+ on the eaves to stop ice damming and clear snowmelt from the roof.

THERMAGUTTER

ThermaGutter is the final step to a complete ThermaLine ice melt system. This slim design is engineered to prevent icicles and ice dams from forming inside of gutters, providing a clean melt path away from your roof.

THERMAFLASHING

ThermaFlashing uses patented technology to prevent ice from forming in problematic areas where walls meet roof structures. The unique raceway secures a single run of UL-listed self regulating heat trace cable for a highly efficient, direct heat transfer to the panel.
